TCA5550

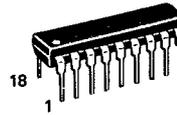

STEREO SOUND CONTROL SYSTEM

The TCA5550 is a single chip stereo balance, volume, bass and treble control circuit designed for use in car radios, TV, and audio systems. Simple dc inputs allow the control to be effected by four inexpensive potentiometers or a remote control system. The bass and treble responses are defined by a single capacitor per control per channel.

- Four High Impedance dc Controls — Vol, Bass, Treble, Balance
- A Single External Capacitor Defines Each Tone Control Characteristic
- Low Distortion, 0.1% at Nominal Input Level, Unity Gain with the Tone Controls Flat
- Channel Separation Better Than 45 dB
- Wide Power Supply Tolerance, 10 to 16 Vdc
- ± 14 dB of Tone Control
- More Than 75 dB of Volume Control
- Wide Dynamic Range: 100 mV to 500 mV_{rms} Input Signal
- Low Output Impedance

NOTES:

1. The control potentiometers to this point, see Figure 7.
2. These figures are functions of the capacitors on Pins 1, 9, 10, 11, 17 & 18. See the application diagram, Figure 7.
3. The input level may be increased to 500 mV_{rms} but the user controls must be adjusted to ensure that the output level does not exceed 300 mV_{rms}.
